

TBT Deep Hole Drilling
Tools, Accessories
and Grinding Machines

COMPANY HISTORY

Across the world, our customers associate TBT Tiefbohrtechnik with reliability, quality, precision and customer proximity - and that for more than 50 years now.

The company has specialised in manufacturing technology for deep hole drilling since it was founded in Dettingen a.d. Erms in 1966. Our aim has always been to be an expert single-source provider of machines, tools and services.

Our rise to market leadership is confirmation that our customers acknowledge our corporate policy.

TBT Tiefbohrtechnik succeeds in combining the flexibility, dedication and customer-oriented approach of a lean, medium-sized enterprise with its presence on the global stage. We have subsidiaries or highly-experienced representatives in virtually all the major countries of the world. Your deep hole drilling requirements are safe in the hands of our highly-qualified, dedicated staff.

Quality is a fundamental pillar of our corporate philosophy, which defines our performance and our products. Our main goal is to provide high quality products based on specific requirements in accordance with market expectations.

As a modern certified company, we ensure you that the operating processes are clearly structured, and our quality management systems are used and applied to all levels of the company. With the DIN ISO 14001 certification at our site in Dettingen / Erms we demonstrate our resource-friendly working methods and our responsibility for the environment.

Our company's mechanical engineering division is DIN ISO 9001 and VDA 6.4 certified, meanwhile the drilling tool and contract drilling divisions are DIN ISO 9001 certified.

We see ourselves as your reliable partner and we actively strive for a long term co operation with you. We are open to dialogue with you so that professional expertise and experience can merge into a single unit on both sides. The result is an integrated, practical solution. Thanks to our dedicated employees, we can guarantee you a precise implementation on schedule.

**HIGH-PERFORMANCE
PRECISION DRILLING**

TBT has been instrumental in shaping and developing deep hole technology. Thanks to the diameter tolerances it achieves, the surface quality and the minimum level of drift, the single-lip drill has proven its value in the area of high-performance precision drilling. In a number of applications, therefore, the deep hole drill principle replaces drilling and reaming with one pass. And it does so at a superior level of process reliability.

However, it doesn't always have to be only deep hole drilling. With its combination of precision and superior drilling performance, the single-lip drill is also eminently suited to work on short and intricate holes.

Single-lip drills are single-edge tools that are guided through a drill bush during their initial drilling phase. These drills can be used not only for deep hole drilling machines but also, for example, for machining centres or automatic lathes. The cooling lubricant moves from the machine to the tool cutting edge through the inside of the tool. In addition to cooling and lubricating the drill head, the pressurised lubricant flushes the chips out of the drill hole.

Deep hole drilling is, therefore, a reliable and efficient means of achieving precision drilling results.

TBT single-lip drills are manufactured to suit any drill diameter (1/1000 mm graduation) between 0.7 mm and far above 50 mm and for total lengths of up to approx. 6000 mm.

We develop and manufacture the tools to meet your requirements, taking into consideration the material to be drilled, the machinery to be used by the customer and the specific drilling situation. It may be a standard tool or one for counterboring existing holes, it may be a step tool for creating precise stepped bores with a minimum centre offset or a special tool for a specific bore surface; it may have no coating or may have a coating and, for high-end requirements, it may have a PCD-tipped tool cutting edge.

TBT is happy to advise you and to fulfil your drill head and shank requirements consistently and without delay, using state-of-the-art design and production procedures. The tool head and shank will be brazed to a clamping sleeve suitable for your machine.

TBT has hundreds of different clamping sleeves in stock at any one time. We also offer a 48-hour service.

SEALING CASE PROCEDURE

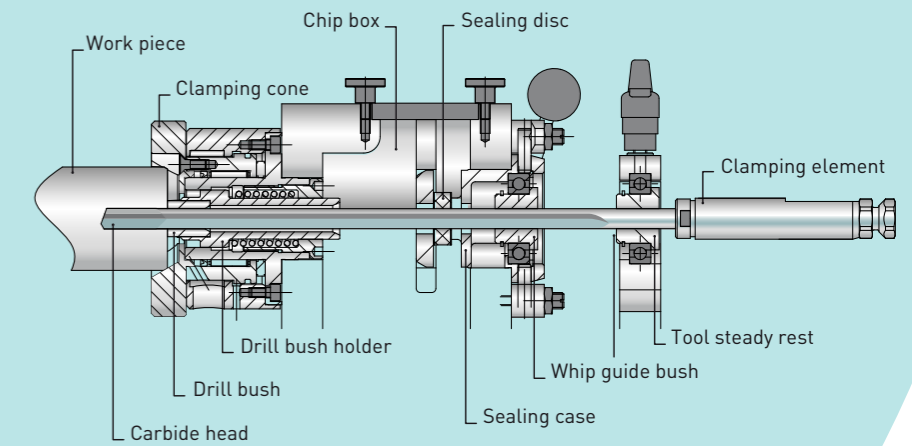

With the sealing case procedure, single-lip solid drill tools are used with a diameter range between 1.9 mm and approx. 50 mm. As the tool lengths can be up to 6000 mm, the tools are guided through steady rests. The clearances between the steady rests should be no wider than 40 – 50 x tool Ø.

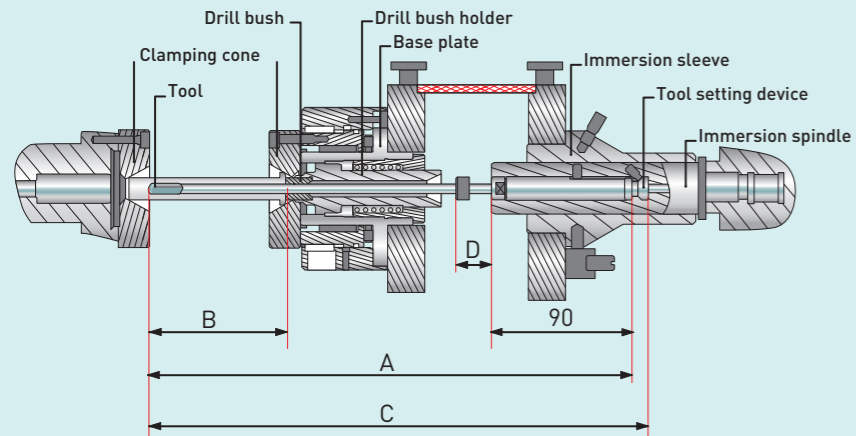

The machine spindle is sealed by the sealing case or the sealing disc inside the case.

The cooling lubricant is supplied through one or more of the holes inside the tool.

The cooling lubricant / chip mixture is discharged through a longitudinal slot (bead) on the outside of the tool shank.

The cutting edge spans the radius of the hole to be drilled. The tool consists of the drill head, beaded shank and the clamping element (sleeve). The "classic" solid single-lip drill has a solid carbide head into which the cutting edge and the guide pads are ground.

- B Drill depth
- C Reference dimension
- D Adjustment distance depending on drill diameter

Length calculation

IMMERSION PROCEDURE FOR SHALLOW DRILLING DEPTHS

Single-lip solid bore tools are used for the diameter range of 0.7 mm to 50 mm. As steady rests are not used, the drill depth in the immersion procedure is limited to a maximum of 160 mm.

This procedure is suited primarily for drilling shallow holes. Tools of less than 2 mm Ø are made entirely of carbide. Solid carbide tools are increasingly used for the diameter range between 2 mm and 12 mm and for relatively shallow drill depths.

The machine spindle is sealed by the immersion sleeve or the immersion spindle.

The cooling lubricant is supplied through one or more of the holes inside the tool. The cooling lubricant/chip mixture is discharged through a longitudinal slot (bead) on the outside of the tool shank.

The cutting edge spans the radius of the hole to be drilled. The tool consists of a drill head, a beaded shank and the clamping element (sleeve). The "classic" solid single-lip drill has a solid carbide head into which the cutting edge and the guide pads are ground.

The trend towards multi-station machining has resulted in single-lip drills being used increasingly on conventional machine tools, for example on machining centres. With its combination of precision and superior drilling performance, the single-lip drill is also used for short and intricate holes.

Unlike deep hole drilling machines, drill bushes are only very seldom used in conventional machine tools. As a result, a pilot hole has to be drilled in the work piece first if a single-lip drill is to be used.

This hole has to meet specific requirements, for example, regarding diameter tolerance or guide length. Our expert team at TBT will be happy to advise you on the appropriate tools from the TBT range, for example single-lip drill, step drill or solid carbide drill, from the TBT range, for example single-lip drill, step drill, solid carbide drill and with indexable inserts.

SINGLE-LIP DRILL WITH BRAZED DRILL HEAD

Single-lip drills with a brazed drill head consist of a drill head made of solid carbide or steel with carbide inserts, a drill shank made of hardened and tempered steel and a steel clamping sleeve. The drill head and the clamping sleeve are brazed to the tool shank.

Diameter range:	1.9 – 50.0 mm
Length:	up to 6000 mm
Effective tool length:	40 – 50 x D
Cooling lubricant required	
deep hole drilling oil preferred	
Filter resolution:	10 – 20 µm
Viscosity:	∅ 1.9 – 50 mm = 10 – 20 mm ² /S

Safety information

We shall accept no liability for damage resulting from the improper handling of our deep hole drilling tools, from operating errors, deficient machine conditions or from the improper use of our tools. All relevant application, emission and safety guidelines and regulations must be observed.

We will be happy to advise you!

SOLID CARBIDE SINGLE-LIP DRILLS

The drill head and shank are made of a single carbide slug. This tool is particularly process reliable and efficient. A longer useful life is achieved due to the low level of torsional vibration.

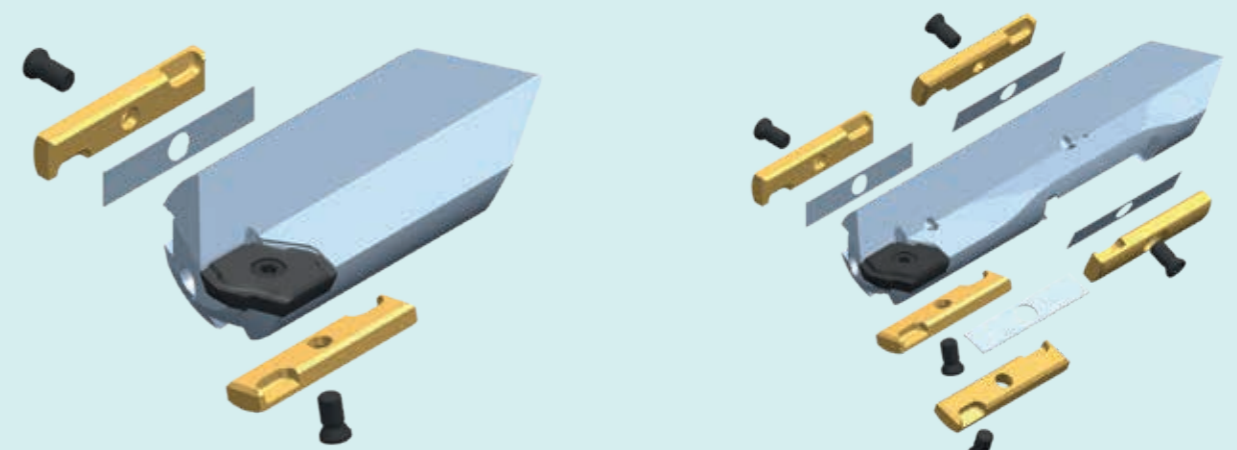

The clamping element (steel) for this type of tool is made with a straightening pin. The clamping sleeves and drill shank are brazed together.

Diameter range:	0.7 – 12.0 mm
Length:	up to 600 mm
Effective tool length:	80 – 100 x D
Cooling lubricant required	
deep hole drilling oil preferred	
Filter resolution:	5 – 10 µm
Viscosity:	∅ 0.8 – 2.0 mm = 7 – 10 mm ² /S ∅ 2.0 – 12 mm = 10 – 20 mm ² /S

Safety information

We shall accept no liability for damage resulting from the improper handling of our deep hole drilling tools, from operating errors, deficient machine conditions or from the improper use of our tools. All relevant application, emission and safety guidelines and regulations must be observed.

We will be happy to advise you!

Series 10

Series 10L

Main Features:

1. **High efficiency** by specifically developed cutting edge geometry for optimal chip formation.
2. **Short downtime** resulting from quick exchange of wear parts on the clamped tool.
3. **Easy to use**, no sharpening, no length adjustment, easy inventory of wear parts.
4. **Long tool life** due to full coating and edge treatment
5. **Quick availability** due to stocked wear parts.

- » Current diameter range: 12.00 mm – 28.00 mm
- » Cutting blade & guide pads fully coated
- » Covering the whole diameter range with only 6 sizes of cutting blades
- » Body in steps of 0.1 mm
- » Available with a long head and three additional guide pads
- » Adjusting shim in steps of 0.01mm to fine tune diameter tolerance

Select your wear parts in the following table:

Material	cutting speed		feed rate mm / rev

CUTTING EDGE GEOMETRY

Symbol	Axis A	Axis B	Axis C	Measure	Comment
	-30°	+12°	+5°	>D/4	Set Axis C such that the chamfer during the second pass is parallel to the chip face. The width of the chamfer is the same as that of the circular grinding chamfer.
	-30°	+20°	+6,5°	Fase 0,3...0,5	
	+20°	+12°	-5°	D/4	
	+30°	+12°	+55°		
	0°	+25°	-5°		

[There may be slight deviation in measurement due to angle distortion]

Changes to the cutting edge geometry of the single-lip drill could affect the drilled surface, the chip shape, drilling tolerance, drill centring, chip removal, surface quality or useful life.

Virtually all drilling tasks can be executed successfully with TBT standard grind facets. Generally speaking, special grind facets, sometimes with a chip separator / chip breaker are required when deep drilling particularly long-chipping materials or materials that are difficult to machine. We already manufacture and develop a wide range of grind sections or manufacture them to customer specifications. The standard grind facets for TBT single-lip drills depend on the drill diameter and the material to be drilled. We recommend TBT universal and tandem grinding machines for regrinding tools.

Symbol	Axis A	Axis B	Axis C	Measure	Comment
	-40°	+25°	+12°	>D/4	Twist the single-lip drill lightly around the circumference without damaging the guide chamfer!
	+30°	+20°	-7°	D/4

	0°	+38°	0°		

[There may be slight deviation in measurement due to angle distortion]

STANDARD CONTOURS

TBT-developed contours are specially tailored to individual applications.

Standard grind section for single-lip drills with $\varnothing = 5$ to 30 mm

Changes to the cutting edge geometry will have a direct effect on bore quality and process reliability.

TBT cutting edge geometry is the result of over 50 years of research and development work by our machine engineering, tool design and machining service departments.

With our cutting edge geometries, no job is too difficult!

Make use of our experience for your drilling jobs!

Standard grind section for single-lip drills up to 5 mm

Contour G60

Standard contour suitable for most materials and drilling jobs. With this contour, the tool diameter can no longer be measured after manufacturing. The standard starting point for the guide pad is 60°, but can range from 45° to 80°.

Contour C

This is the preferred contour for narrow tolerances in terms of bore diameter and surface. Some of the guide pads are convex ground. The circular grinding chamfer can protrude over the guide pads.

Contour A

Contour for unfavourable drilling conditions when drilling or for cross-drilling. Machining soft materials or with a poorly-performing cooling lubricant. Is often used at the cylindrical guide part (long drill head).

Contour D45

This contour is used almost exclusively for soft materials such as grey cast iron, graphite, ..., particularly in connection with narrow bore tolerances.

Contour S

Contour EA

Contour F

Contour GA80

Patented HS cutting edge geometry

HIGH-SPEED SINGLE-LIP DRILL

Innovative TBT high-speed cutting edge geometry, precision-ground tool surface and ultra smooth coating due to own top finishing allows for feed speeds of up to factor 5 compared with conventional carbide single-lip drills. We will be happy to provide further information on request.

DOUBLE-LIP DRILL

Double-lip drilling – a procedure related to deep hole drilling – is used for diameter ranges of 6 to 25 mm and for l/d ratios of up to maximum 30 to 40. The tools are double-edged and generally have two guide pads in addition to the two circular grinding chamfers. These tools are made of solid carbide or a solid carbide drill head and steel tube or a solid steel shank. Due to their smaller flute, these tools should be used preferably for short-chipping materials.

SINGLE-LIP STEP DRILL

Used where several bore diameters are included in one pass. Meets the strictest requirements in terms of concentricity and coaxiality.

SOLID CARBIDE SINGLE-LIP STEP DRILL

Used where several bore diameters are included in one pass. Meets the strictest requirements in terms of concentricity and coaxiality.

OVERVIEW - CLAMPING ELEMENTS

Clamping sleeves

In addition to a wide range of standard clamping sleeves, TBT also manufactures bespoke clamping sleeves in accordance with your specifications (drawing or sample).

Surface quality (reference values)

SURFACE QUALITY

The radial energy generated during drilling is transferred to the bore wall through the guide pads, resulting in the surface being pressed smooth.

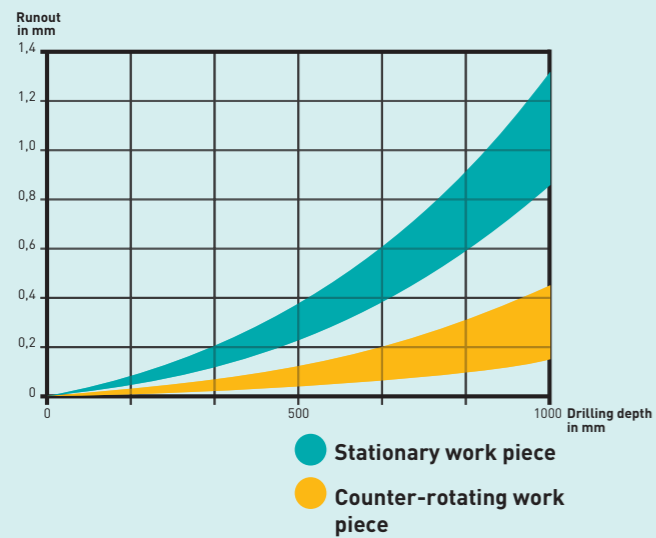

This effect can be increased even more by adjusting the design of the guide pads, giving an outstanding surface quality.

Diameter tolerance

Diameter tolerances of up to IT 7 can be achieved in production with TBT single-lip drills.

RUNOUT

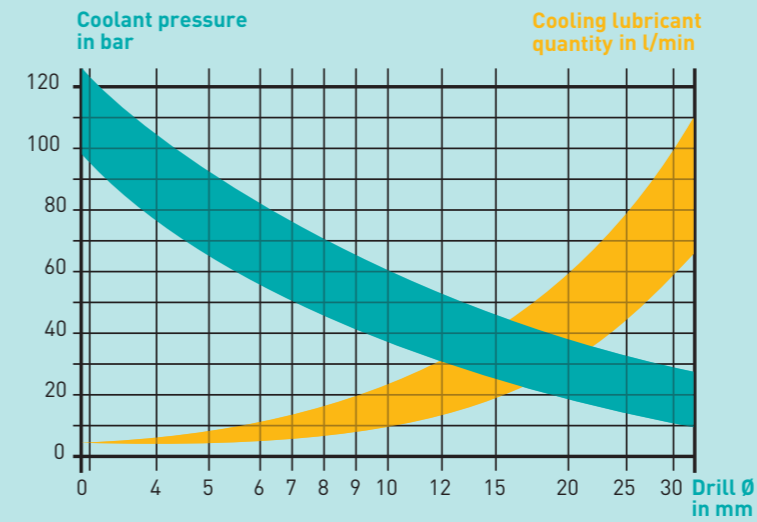

As a result of the drill bush or the pilot bore on the work piece together with the bore itself, the single-lip drill achieves precision, restricted guidance, and the drift is, therefore, kept to a minimum.

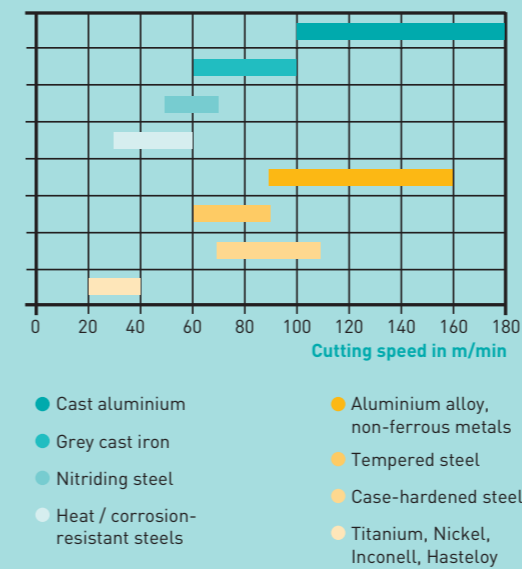

Runout (reference values)

COOLING LUBRICANTS

An efficient and correctly dimensioned coolant system and filter are required in order to ensure the economic viability and process reliability of deep hole drilling. A further consideration is the requirement to adhere to a minimum level of fat content (depending on the material) when using emulsion. We recommend the use of deep hole drilling oil for small drill diameters and high-alloy steels.

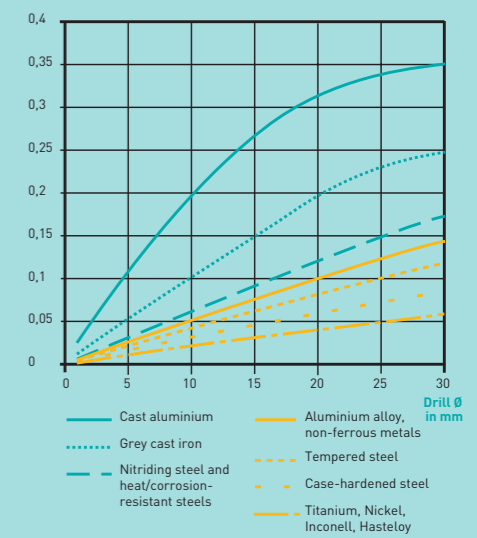

Cooling lubricants (reference values)

Cutting speed (reference values)

CUTTING SPEED

Please see the tables on pages 30 – 33 for details of the various cutting speeds and feed values.

Feed (reference values)

Machining accessories, drill bush

Centring guide at the start of drilling until the tool centres itself in the hole.
Available in steel or carbide.
Drill Bushes according to TBT standard ensure a safe and smooth chip evacuation.

Please note when ordering: Please state machine number and drill diameter when ordering.

Clamping cone

Machining accessories, clamping cone

For clamping and centring rotationally symmetric work pieces.

Tool holder

Machining accessories, tool holder

Clamping / anchoring the tools.

General view of length measuring device

MACHINING ACCESSORIES, TOOL SETTING DEVICE

The length measuring device is a precision instrument for setting the drill length. The above illustration shows the length measuring device and its components.

The adaptor (4) holds the plug gauge and the drill to be measured. In the case of greater lengths, the drills are supported by the sliding V-blocks which are height-adjustable and can be locked.

The sliding carrier plate (9) with mounted magnetic sensor determines the zero point and measures the length. The measurement is displayed at the position indicator (7). The incline of the position indicator is adjustable and can be adapted to the lighting conditions and the height of the operator.

The cable connecting the magnetic sensor to the position indicator is enclosed in a cable drag chain (15).

The measuring length can be extended by moving the stop plate (8) to the end of the sliding carrier plate (9).

While we supply different versions of the length measuring device, the description and operation of the devices are essentially the same.

- » table-top version
- » stand-alone version with base, drill support and plastic boxes for small parts

- 1 Base holder
- 2 Support bolt
- 3 Holder for adaptor
- 4 Adaptor
- 5 Plug gauge
- 6 V-blocks
- 7 Position indicator
- 8 Stop plate
- 9 Moving carrier plate
- 10 Magnetic sensor
- 11 Magnetic tape
- 12 Linear guide
- 13 Supports
- 14 Fastening screws
- 15 Cable drag chain

Tandem grinding machine

Universal grinding machine

Grinding machine

Our wide variety of re-sharpening devices enables you to regrind your single-lip drills yourself. Our many years of experience in this field have informed the design and manufacture of our grinding machines, devices and associated accessories.

Tandem grinding machine

A high-precision, double-spindle grinding machine designed for precision re-sharpening of larger-series single-lip drills with the same cutting edge geometry and a diameter range of 2.0 mm to approx. 20 mm.

Up to five different tool positions allow for all angles required for five-facet grinding to be re-set, making grinding even simpler. The lateral oscillation of the spindle unit is electromechanical.

- » Cutting edge geometry only has to be set once
- » Fully replaceable adaptor for different geometries and for setting the geometries
- » Eight different tool holder cassettes cover the entire range of tool diameters

A further accessory available is the dry dust extractor for efficient removal of any grinding dust in the work area.

TBT Universal clamping device

Our universal clamping device can be used on all conventional tool grinding machines. The benefits of the clamping device used on our TBT universal grinding machine speak for themselves:

- » Compact device, adjustable in three axes for grinding of all standard geometries for single-lip drills

- » Device for supporting particularly long single-lip drills
- » Two different clamping ranges [2.5 – 32 mm and 5.0 – 45 mm] cover a broad spectrum of tool diameters

In addition, our TBT universal clamping device can be fitted with a grinder holder with integrated lighting and 20x measurement microscope, for optimum re-sharpening of your very small single-lip drills (1.0 – 3.5 mm).

TBT universal grinding machine

A ready-to-operate machine for your specific requirements: the grinding spindle unit and our tried-and-tested TBT universal clamping device are mounted together on a solid plate, allowing for optimum regrinding quality for excellent drill results. A matching base and extraction unit are also available.

REFERENCE VALUES FOR DEEP HOLE DRILLING OF VARIOUS MATERIALS FOR SOLID CARBIDE SINGLE-LIP DRILLS

Material groups	Spring steels, hardened steels, high-temperature steels, cast steel / chilled cast iron, Special alloys, e.g. Nimonic, Inconel, titanium, titanium alloys	Stainless, acid-resistant steel + cast steel, austenitic 18 – 25% Cr, Ni > 8%	Stainless steel + cast steel, martensitic / ferritic 13 – 25% (sulphurated) "good machinability"	Alloyed tempered steels, case-hardened steels, nitriding steels, tool steels, (> 900N/mm ²)

Cutting speed and feed levels depend on: tool length, cooling lubricant, material and the stability of the machine elements and work piece clamping. All values are reference values.

REFERENCE VALUES FOR DEEP HOLE DRILLING OF VARIOUS MATERIALS FOR SINGLE-LIP DRILLS WITH BRAZED-ON CARBIDE HEAD

Material groups	Cast iron, grey cast iron (> 300 N/mm ²), ductile cast iron (> 400 N/mm ²), general steel casting	Cast iron, grey cast iron (< 300 N/mm ²), ductile cast iron (< 400 N/mm ²), malleable cast iron, whiteheart malleable iron, blackheart malleable iron, "good machinability" 70 – 100	Non-alloy and low-alloy structural steel, machining steel, tempered steel, case hardened steel, tool steel (< 900N/mm ²), "good machinability"	Copper, bronze, brass, plastics	Aluminium + cast aluminium Si content > 5%, "good machinability"	Aluminium + aluminium alloy Si content < 5%, "not hardened"
Cutting speed in m/min	60 – 90	70 – 100	70 – 100	80 – 150	80 – 160	100 – 300

Drill Ø in mm	Feed mm/rev.
